If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Jack V. Musgrove (Reg. no. 31,986) on 3/17/09. In an earlier interview (on 1/21/09), Mr. Musgrove clarified that the term "application code" as used in the current application is meant to refer to program source code or compiled program code, not message authentication codes nor header information. The examiner suggested the amendment seen below to clarify the scope of the invention so as to limit "application code" only to what applicant meant. As per MPEP 713.04, a separate interview summary form is not provided since the substance of the interview has been summarized herein.

The application has been amended as follows:

AMEND THE FOLLOWING CLAIMS AS FOLLOWS:

10. (Currently amended) A method for secure communication between a client and a server in a database processing system, the method comprising:

generating a client message at the client;

retrieving an embedded server public key from a read-only memory structure in an article of manufacture in the client, the read-only memory structure having an

embedded client private key, the embedded server public key and the embedded client private key not being related by a public/private key pair relationship, the embedded client private key being associated with a client public key generated and stored exclusively outside the client;

encrypting the client message with the embedded server public key;

sending the client message to the server;

receiving a server message including application code from the server at the client in response to the client message, the application code having a first portion encrypted with a server private key and a second portion which is not encrypted by a public key algorithm, wherein the first portion of the application code is small relative to the second portion of the application code;

authenticating the first portion of the application code with the embedded server public key; and

authenticating the second portion of the application code using an integrity checking algorithm that is less computationally expensive than a public key algorithm,

wherein the application code is either program source code or compiled program source code.

25. (Currently amended) A method for secure communication between a client and a server in a data processing system, the method comprising:

receiving a client message from the client;

retrieving a server private key;

decrypting the client message with the server private key;

retrieving a client serial number from the decrypted client message;

retrieving a client public key that is associatively stored with the retrieved client serial number, wherein the client public key corresponds to an embedded client private key in a read-only memory structure in an article of manufacture in the client and is generated and stored exclusively outside the client; and

generating a server message including application code at the server in response to the client message, the application code having a first portion encrypted with the server private key and a second portion which is not encrypted by a public key algorithm, the first portion being authenticable with a server public key and the second portion being authenticable with an integrity checking algorithm that is less computationally expensive than a public key algorithm, wherein the first portion of the application code is small relative to the second portion of the application code;

wherein the read-only memory structure has an embedded server public key, the embedded server public key and the embedded client private key not being related by a public/private key pair relationship,

wherein the application code is either program source code or compiled program source code.
